

# Blinkit Business Performance Analysis

## Integrated Analytics Solution for Sales, Demand, Delivery & Marketing Optimization

---

### 1. Executive Summary

Blinkit's management team required a centralized reporting solution to evaluate business performance across customer growth, product demand, delivery operations, and marketing effectiveness.

To support this objective, an integrated Excel-based analytics solution was developed using transactional, operational, customer, delivery, and marketing data. The dashboard framework was designed to answer key business questions related to GMV growth, customer retention, inventory planning, service quality, and marketing ROI.

The analysis revealed strong dependence on repeat customers, concentrated demand among specific products and locations, operational delivery challenges in selected regions, and opportunities to improve marketing spend allocation. The resulting insights provide management with actionable recommendations to improve GMV growth, operational efficiency, customer experience, and marketing performance.

---

### 2. Business Problem Statement

As Blinkit continues to scale its quick-commerce operations, management requires visibility into the factors influencing GMV performance, customer behavior, product demand, delivery reliability, and marketing effectiveness.

Several critical business questions needed to be answered:

#### Sales & Customer Growth

- Is GMV growth being driven by new customers or repeat customers?
- Which customer segments contribute the highest GMV?
- Are there seasonal GMV trends that impact business performance?

#### Demand & Inventory Planning

- Which products and categories generate the highest demand?
- Which locations contribute the largest share of orders?
- Where should inventory planning efforts be prioritized?

#### Delivery Operations

- How effectively is Blinkit meeting its delivery commitments?
- Which cities experience the highest delivery delays?
- Are there operational patterns affecting service quality?

## Marketing Effectiveness

- Which acquisition channels generate the most GMV?
  - Which campaigns acquire customers most efficiently?
  - Is marketing spend generating acceptable returns?
- 

## 3. Dataset Overview & Preparation

The project utilized multiple datasets representing different business functions:

- Orders Data
- Customer Data
- Product Data
- Delivery Data
- Marketing Performance Data

Data preparation was performed using Power Query and Excel transformation techniques. Missing values were standardized, analytical datasets were prepared, and business metrics were created to support dashboard reporting.

Additional metrics included:

- GMV Per Customer
  - Customer Segmentation
  - On-Time Delivery Rate
  - SLA Breach Time
  - Click Through Rate (CTR)
  - Conversion Rate (CVR)
  - Cost Per Acquisition (CPA)
  - Return On Ad Spend (ROAS)
- 

## 4. Dashboard Design & Development

To answer the identified business questions, four interactive dashboards were developed using Microsoft Excel.

### Dashboard 1 – Sales Performance

Designed to evaluate GMV trends, customer behaviour, repeat purchase contribution, and segment performance.

### Dashboard 2 – Demand Analytics

Designed to identify demand patterns, category performance, product popularity, and geographical demand concentration.

### Dashboard 3 – Delivery Performance

Designed to monitor delivery efficiency, SLA compliance, regional performance, and operational bottlenecks.

## **Dashboard 4 – Marketing Performance**

Designed to evaluate campaign effectiveness, customer acquisition costs, channel performance, and marketing ROI.

The dashboards were built using Pivot Tables, Pivot Charts, KPI Cards, Slicers, Conditional Formatting, and interactive Excel reporting techniques.

---

# **5. Key Insights & Findings**

## **Dashboard 1 – Sales Performance**

### **GMV Growth & Customer Behaviour**

The business generated approximately ₹1.10 Cr in GMV from 5,000 completed orders, producing an average GMV per customer of ₹5,068.74. This indicates strong customer value generation and healthy spending behaviour.

### **GMV Dependency**

Repeat customers contributed 94.06% of total GMV while new customers generated only 5.94%. GMV growth is therefore highly dependent on retaining existing customers rather than acquiring new ones.

### **Customer Segment Contribution**

GMV contribution is distributed across customer segments in terms of participation, but repeat customers remain the dominant driver of total GMV. This reduces concentration risk from any single segment.

### **Seasonal GMV Patterns**

GMV performance strengthened significantly during the second half of the year, with August and December emerging as peak-performing months. This suggests seasonal purchasing behavior and promotion-driven demand spikes.

---

## **Dashboard 2 – Demand Analytics**

### **Product Demand**

More than 10,000 units were sold across 5,000 orders, indicating that customers frequently purchase multiple products per transaction.

## High-Demand Products

Pet Treats, Toilet Cleaner, Cough Syrup, Lotion, and Vitamins emerged as the most purchased products, demonstrating consistently recurring customer demand.

## Category Performance

Dairy & Breakfast generated the highest category GMV, making it one of the strongest contributors to overall business performance.

## Geographic Demand Concentration

Order volume is concentrated within selected cities, with Orai recording the highest demand among analysed locations. Demand is therefore not evenly distributed across regions.

---

## Dashboard 3 – Delivery Performance

### Service Reliability

Only 69.40% of deliveries were completed within the promised delivery window, while 30.60% experienced delays. This indicates a significant opportunity to improve service consistency.

### SLA Performance

The average delivery time was 19.43 minutes, yet delayed orders exceeded SLA commitments by nearly 15 minutes on average. Delivery delays are therefore meaningful enough to impact customer experience.

### Regional Operational Challenges

Orai recorded the highest delay rate among analyzed cities, suggesting localized operational inefficiencies that require further investigation.

### Weekly Performance Trends

Monday experienced the highest level of delayed deliveries, indicating potential workforce planning or capacity allocation challenges at the beginning of the week.

---

## Dashboard 4 – Marketing Performance

### Marketing ROI

Marketing activities generated ₹3.22 Cr in GMV from ₹1.63 Cr in advertising spend, resulting in an overall ROAS of 1.97x. Marketing investment is generating positive returns but remains indicating scope for improvement in marketing efficiency.

## **Conversion Efficiency**

The overall conversion rate reached 10.09%, indicating effective customer acquisition and strong campaign performance across channels.

## **Channel GMV Contribution**

GMV generation remains balanced across Email, App, Social Media, and SMS channels. This diversified acquisition mix reduces dependence on any single channel.

## **Campaign Efficiency**

Referral Program and New User Discount campaigns delivered the lowest acquisition costs, making them the most efficient customer acquisition initiatives.

## **Funnel Performance**

Email campaigns generated strong engagement levels, while App and Social Media channels demonstrated stronger balance between engagement and conversion outcomes.

---

# **6. Strategic Actions & Opportunities**

## **Dashboard 1 – Sales Performance**

### **Expand Customer Acquisition**

Increase investment in customer acquisition initiatives to reduce GMV dependence on repeat customers and create a more balanced long-term growth strategy.

### **Strengthen Customer Retention**

Develop targeted retention programs for high-value customers through loyalty rewards, personalized offers, and engagement campaigns to protect the primary GMV base.

### **Leverage Seasonal Demand**

Analyse the factors driving strong performance during August and December and replicate successful promotions and campaigns during lower-performing months.

---

## **Dashboard 2 – Demand Analytics**

### **Improve Demand planning**

Maintain higher inventory levels for high-demand products to minimize stockouts and ensure consistent product availability.

## **Focus on High-Performing Categories**

Prioritize supplier planning and inventory allocation for Dairy & Breakfast products due to their significant contribution to overall GMV.

## **Enhance Demand Forecasting**

Implement location-specific demand forecasting to improve inventory distribution and replenishment planning in high-demand cities.

---

## **Dashboard 3 – Delivery Performance**

### **Address Regional Delivery Challenges**

Conduct operational reviews in Orai to identify route, staffing, fulfillment, or logistics issues contributing to higher delivery delays.

### **Optimize Capacity Planning**

Increase delivery capacity during Monday peak periods to improve service consistency and reduce SLA breaches.

### **Strengthen Delivery Monitoring**

Implement proactive delivery tracking and alert systems for orders approaching SLA thresholds to reduce preventable delays and improve customer experience.

---

## **Dashboard 4 – Marketing Performance**

### **Invest in High-Performing Channels**

Allocate additional budget toward App and Social Media channels due to their strong balance between customer acquisition and conversion performance.

### **Scale Cost-Efficient Campaigns**

Expand Referral Program and New User Discount campaigns because they acquire customers at lower costs compared to other marketing initiatives.

### **Improve Conversion Performance**

Optimize Email campaign landing pages and post-click experiences to increase conversion rates and maximize returns from existing engagement levels.

## 7. Business Impact

This project provides Blinkit's management team with a centralized performance monitoring framework capable of supporting strategic and operational decision-making.

The dashboard solution enables stakeholders to:

- Monitor GMV growth and customer performance.
- Identify key products and categories driving demand.
- Improve inventory allocation and replenishment planning.
- Track delivery reliability and SLA compliance.
- Optimize marketing spend allocation and acquisition strategies.
- Detect operational bottlenecks before they significantly impact customers.

By consolidating Sales, Demand, Delivery, and Marketing performance into a single reporting framework, the project transforms business data into actionable intelligence that supports profitability, operational excellence, and long-term growth.

## 8.Tools Used

- Microsoft Excel
- Power Query
- Pivot Tables
- Pivot Charts
- Slicers
- KPI Cards
- Conditional Formatting
- Excel Formulas
- Data Cleaning & Transformation
- Dashboard Design
- Business Analytics
- Data Visualization
